What's for Dinner?

A site (and hopefully eventually an app) that users can interact with to build a calendar of meal choices.

Features:

- Favorite meal input – user can input favorite meals and tag them into categories (e.g., main dish, side, lunch, dinner, takeout)
  - List can be maintained – add, delete, edit
- Calendar – user can add meals from favorites list to the calendar (i.e., meal planning)
  - Calendar has multiple options – start day (Sun-Sat, Mon-Sun, etc.), which meals to plan for (three meals a day, just dinner, etc.)
  - Can add multiple entries to same meal (e.g., main dish and a side)
  - On the fly additions for "special" meals that aren't part of favorites list

1. How your project will benefit from React

- What are the main differences between Bootstrap and React?
- What will React allow you to do that would have been difficult with Bootstrap?
  - Interact with user supplied data
  - Search

2. Expected List of React Components

- A brief list of the React Components you will need to develop for your application
  - Form (to input favorite meals)
  - Date picker
  - Modals?
  - Drag and drop?
  - ???
- Brief justifications for including these components
  - Want to create a user friendly design that's also functional
